Business needs for the AliExpress Affiliate API permission groups

App: marketTon | Affiliate account: Everton Felix de Oliveira (individual, Brazil) | Website: https://mural.felixsystems.com.br

1. Who we are

Mural na Web is a Brazilian affiliate showcase that recommends useful household, kitchen and kids' products found on AliExpress. The marketTon app is our own internal tool: it reads the Affiliate API to select products, generate affiliate links and track our own commissions. It does not collect or store any buyer data.

2. Why we need the SKU Dimension API

We only recommend products that reach Brazilian customers quickly. Our rule is to list only items with delivery time of up to 10 days, preferring items shipped from Brazil. The standard Affiliate API does not return delivery time or ship-from country. The SKU-level product detail API provides this information, so we can filter out slow or international-only shipments before promoting a product and avoid disappointing our visitors.

3. Why we need the Advanced API

The hot products query and smart match API let us find products that are already trending and match what Brazilian shoppers search for, so we promote items with real demand instead of guessing. We combine this with Google search volume before spending any advertising budget.

4. How the data is used

Low request volume (a few dozen calls per week, scheduled). Data is used only to rank and filter products and to build affiliate links on our own website and social channels (Instagram and Facebook) with clear affiliate disclosure. No resale of data, no scraping, no automation against the AliExpress site.
